Making it Possible.

TXT Group overview

TXT is an international **software and engineering** company with over **35 years of experience in the Aerospace & Defence sector**. We specialize in the development of advanced training and simulation systems, as well as certified embedded software for on-board safety-critical applications. Leveraging deep domain expertise, we support the entire software lifecycle, from requirements definition to certification, ensuring reliability and compliance with the highest industry standards.

Aerospace & Defence
Training & Simulation solutions

TXT provides **highly specialized services** to support TDMs, OEMs and training organizations during the development of complex training systems. **We develop specific solutions** for each customer, starting from assets consolidated over 25 years of experience and already used and tested by other **big market players**.

Flight Simulator

- Flight Test support & Data Package creation
- Dynamics & Systems modeling
- Avionics, Displays & Cockpit simulation and integration
- Support Toolset
- Qualification support (up to FFS level D)

Ground, Mission and Cabin Crew

- Maintenance training
- Airport operations
- Hoist & rescue operations
- Rear crew mission training
- Radar/ECM/ESM crew training
- Cabin crew procedural training

XR Training

- Proprietary platform Pacelab WEAVR
- Training in a full digital environment

Ground Stations

- Mission planning & Debriefing
- HUMS: Aircraft systems and components status monitoring
- Map service: Development of digital maps for on-board and ground tools

Distributed Simulation

- Integration of multiple simulation systems, platforms, and domains using DIS/HLA protocols
- Integration of sensor simulation
- Real time synthetic scenario and mission simulation

Digital Twin

- High-fidelity virtual replicas of real-world systems
- Real-time synchronization with operational data
- Different levels of complexity, from standalone systems, to an entire operational scenario

Aerospace & Defence
Embedded Systems solutions

TXT provides **end-to-end support** to all development and integral processes for **avionic applications**, all the way to certification. Our expertise leverages a wide set of **V&V services** in order to ensure compliance with expected quality standards throughout the **system development phases**.

Embedded Software Engineering

- RTCA DO-178C Compliant Software
- Model based driven approach with automatic code generation

System Engineering

- Development of algorithms for the automatic control of air vehicles
- Integration of different systems and components

Test & Validation

- Collection and management of system requirements regulations
- Testing and validating software through rigorous processes to ensure security and reliability requirements

Certification Support

- DO-178C and DO-254 compliant avionics systems
- Cybersecurity in aeronautical domain

Test Environment Development

- Re-host on COTS computers and full development cycle support through final target emulation
- Turnkey solutions for test system design and testing environment

UX | UI

- Creating wireframes and prototyping interfaces for cockpit systems
- Prototyping tools to develop interactive mockups

Aerospace & Defence
Smart solutions

VAPS XT is a full-feature software for rapid development of interactive graphical **HMI displays for avionics, embedded applications & safety critical systems**. It provides qualifiable code generation for rapid development of DO-178C certifiable software.

WEAVR is a uniquely holistic platform designed to completely manage **XR training environment**. It is easy to use, highly configurable and scalable to the enterprise level.

InstructIQ provides data-driven pilot competency analytics using **Artificial Intelligence to make training more efficient and effective**. It analyzes flight simulator data in real time, showing insights into the performance of each flight maneuver.
